PREFACE

The population of any country is a state of flux both in terms of its size and characteristics. The periodic census enumeration obtains data on the size and composition of the population at the time census was taken. But for many purposes, it is important to know the number and characteristics of the people at different dates between the two censuses. With the Government's commitment to stabilizing the population of India by 2045 as stated in the National Population Policy (NPP) 2000, it is imperative to have an idea of the likely growth of the population in future. At the same time, various development schemes targeting to improve the quality of life, require information on the number and proportion of persons in future in different age-groups, their rural-urban distribution etc. Surprisingly, unlike in the past, the need for the projected population is not only being felt by the official agencies alone, even private sector need age-sex wise projected population for better planning of their business.

Since 1958, Office of the Registrar General, India has been undertaking the exercise of population projections on behalf of the Planning Commission of India. After every census, the Expert Committee/Technical Group under the Chairmanship of Registrar General, India (RGI) has been attempting to do it and present data on population projections on the basis of the latest available census data. The present projections based on the age-sex distribution of population and migration data of 2001 Census, latest available levels and trends of fertility and mortality data available from the Sample Registration System (SRS) is an effort in the same direction.

A Technical Group was constituted by the National Commission on Population (NCP) in 2001 under the Chairmanship of the Registrar General, India to prepare population projections for the period 2001-2025. The mandate given to the Group was, among other points, to review the methodology of population projections adopted in the past and prepare fresh projections upto the year 2025 with age, sex, urban-rural and States/UT break-ups for the five-year intervals. After the release of the age-sex distribution data of the population for India/states and migration data based on Census 2001, with the latter released only in November 2005, the present Report has become possible to be finalized. A copy of the relevant order constituting the Group, its composition and terms of reference has been appended at the end of the Report.

This Report contains, in addition to the final projected figures of population and its characteristics, the assumptions and the methodology adopted in projecting different demographic indicators. A 'Summary of Findings' has been provided at the beginning of the Report to give in nutshell the population details alongwith the behaviour of related demographic indicators at the national and state levels in the years to come. In Appendix 2, under the Section 'Detailed Tables', first two Tables 17 and 17A at the national and state levels provide the projected population figures and related important characteristics at a glance, which are a summary of the projection results. Some charts and graphs have been added in the Report to make it attractive and user friendly.

I wish to place on record my sincere thanks to the members of the Technical Group for their contributions to the deliberations and suggestions from time to time. My special thanks are due to Prof. P.N. Mari Bhat, Director, International Institute for Population Sciences, Mumbai for his suggestions from time to time on the technical aspects, which have made a difference to the presentation of the Report. I wish to take Ms. Krishna Singh, then Member Secretary and Mr. V. Asokan, then Joint Secretary of the NCP for their support.

The Report has been prepared in the Demography Division of the organization. My predecessor Mr. J.K. Banthia had initiated the work, which has been completed later. I must place on record the contributions made by Dr. D. Roy Choudhury, Assistant Registrar General (Demography), Ms. Renuka Ravindran, Senior Research Officer, Dr. S.S. Hiremath,

Deputy Director and Mr. S.C.L. Meena, Statistical Investigator, Grade I, who have put in real efforts in completing this Report. I must also place on record my deep appreciation of all the officials and staff of the Demography Division, Census Division, Vital Statistics Division, Map Division and Printing Section, who have put in great effort in completing this Report.

I hope the data contained in this publication will be of use to the government ministries, departments, non-government agencies, research institute, planners, policy makers and demographers.

New Delhi,
May 2006

D. K. Sikri
Registrar General and
Census Commissioner, India

SUMMARY OF FINDINGS

Population projection is a scientific attempt to peep into the future population scenario, conditioned by making certain assumptions, using data relating to the past available at that point of time. Assumptions used and their probability of adhering in future, forms a critical input in this mathematical effort. Predicting the future course of human fertility and mortality is not easy, especially when looking beyond in time as medical and health intervention strategies, food production and its equitable availability, climatic variability, socio-cultural setting, politico economic conditions and a host of other factors influence population dynamics, making it difficult to predict the growth with certainty. Therefore, caution must be exercised while making or using the population projections in the context of various conditions imposed.

The Component Method is the universally accepted method of making population projections because growth of population is determined by fertility, mortality and migration rates. Twenty-one States have been considered and applied the Component method. They are Andhra Pradesh, Assam, Bihar, Chhattisgarh, Delhi, Gujarat, Haryana, Himachal Pradesh, Jammu & Kashmir, Jharkhand, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttaranchal, Uttar Pradesh and West Bengal. The projection of the seven north-eastern states (excluding Assam) has also been carried out as a whole. For the State of Goa and six Union territories, Mathematical Method has been applied. The data used are 2001 Census and Sample Registration System (SRS). SRS provides time series data of fertility and mortality, which has been used for predicting their future levels.

The salient features of the population projections at the national level, and some of the underlying assumptions in this regard, are as under:

- The population of India is expected to increase from 1029 million to 1400 million during the period 2001-2026 - an increase of 36 percent in twenty- five years at the rate of 1.2 percent annually. As a consequence, the density of population will increase from 313 to 426 persons per square kilometer.
- The crude birth rate will decline from 23.2 during 2001-05 to 16.0 during 2021-25 because of falling level of total fertility. In contrast, the crude death rate is expected to fall marginally due to changing age structure of the population with the rising median age as a result of continuing decline in fertility and increase in the expectation of life at birth. It will drop from 7.5 during 2001-05 to 7.2 during 2021-25.
- The infant mortality rate of the country, which is reported to be 63 in 2002, is estimated to decline to 61 during the period 2001-05 and is expected to go down to 40 by the end of the period 2021-25.
- Between 2001 and 2026, because of the declining fertility, the proportion of population aged under 15 years is projected to decline from 35.4 to 23.4 percent; the proportion of the middle (15-59 years) and the older ages (60 years and above) are set to increase considerably. With the declining fertility, alongwith the increases in life expectancy, the number of older persons in the population is expected to increase by more than double from 71 million in 2001 to 173 million in 2026 - an increase in their share to the total population from 6.9 to 12.4 percent. The proportion of population in the working age-group 15-59 years is expected to rise from 57.7 percent in 2001 to 64.3 percent in 2026.
- Another important consequence of the declining fertility will be that, at the national level, the population in the school-going age of 5-14 years is expected to decline from 243 million in 2001 to 222 million in 2026. The share of the population aged 5-14 years to total population of all ages is expected to decrease by 5 percent from 24 percent in 2001 to 19 percent in 2011 and by 3 percent between 2011 to 2026 (19 to 16 percent).

- The youth population in the age- group 15-24 years is expected to increase from 195 million in 2001 to 240 million in 2011 and then continue to decrease to 224 million in 2026. Its proportion to total population is expected to fall from 19 percent in 2001 to 16 percent in 2026. A table showing projected population aged 5-14 years and 15-24 years at the national and state levels is enclosed as Appendix at the end of the report.
- From the above, it is evident that, 54 percent of the population in the country, are aged 24 years and below in 2001, constituting 35 percent and 19 percent in the ages 0-14 years and 15-24 years respectively. The combined proportion of these two age-groups is expected to fall from 54 percent in 2001 to 39 percent in 2026. The average Indian will be expected to be of 31 years old in 2026 compared to 23 years old in 2001.
- Out of the total population increase of 371 million between 2001 and 2026, the share of the workers in the age-group 15-59 years in this total increase is 83 percent. This has implication in the productivity of labour in future.
- The sex ratio of the total population (females per 1000 males) is expected to decrease (i.e. become less feminine) from 933 in 2001 to 930 during 2026.
- The Total Fertility Rate (TFR) is expected to decline from 2.9 during 2001-2005 to 2.0 during 2021-25. The assumption is that the Total Fertility Rate (TFR) would decline steadily and would touch the floor value of 1.8 in some states. With this, the weighted TFR is projected to reach the replacement level of 2.1 by the period 2021.
- The urban population in the country, which is 28 percent in 2001, is expected to increase to 38 percent by 2026. The urban growth would account for over two-thirds (67 percent) of total population increase by 2026. Out of the total population increase of 371 million during 2001-2026 in the country, the share of increase in urban population is expected to be 249 million.
- The demographic projections suggest that by 2026, the population of India will reach 1,384 million 'with AIDS' compared to 1,400 million 'without AIDS'. Although, the projected reduction of about 16 million seems to be large in absolute terms, but it is negligible in so far as the proportion to the total population of the country is concerned. Out of this reduction, cent percent may not be taken as death due to the impact of AIDS because of the reason that there have also been fewer births due to early deaths of women in the reproductive age. If the reduction is decomposed in the ratio of 70:30 for the death due to AIDS and fewer births, then about 11 million people are expected to die in the country due to AIDS at the end of the projection period 2026.

Changes in the age structure of the projected population at the national level between 2001 and 2026 have been depicted by graph (Fig. 1) and population pyramids (Figs. 2 and 3), which are enclosed at the end of the present 'Summary of Findings'. Fig. 1 shows the trend of the population by broad age-groups explained above. It is observed from the said population pyramids that in 2001, older cohorts would be smaller than younger cohorts. Subsequently, with the decline in fertility, the base of the pyramid in 2026 would narrow down, while the middle would be broadened.

Considerable variation in the demographic growth amongst the States has been estimated. The salient features of the projections at the state level are as under:

- The State, which is expected to have least growth in the quarter century (2001-2026) is Tamil Nadu (15 percent), followed by Kerala (17 percent). In contrast, Delhi will have the highest projected growth of 102 percent during 2001-2026. States, which will have projected growths in the range of 20-30 percent are Himachal Pradesh, Punjab, West Bengal, Orissa, Andhra Pradesh and Karnataka. The population in the states of Haryana, Rajasthan, Uttar Pradesh and Madhya Pradesh is projected to increase by 40-50 percent during 2001-2026, which is above the national average of

36 percent. The population of Uttar Pradesh is expected to be highest among all the states of the country at almost 249 million in 2026.

- Of the projected increase in population of 371 million in India during 2001-26, 187 million is likely to occur in the seven States of Bihar, Chhattisgarh, Jharkhand, Madhya Pradesh, Rajasthan, Uttar Pradesh and Uttaranchal (termed as BIMARU states, since it was so before division). Thus nearly 50 percent of India's demographic growth during this period of twenty five years, is projected to take place in these seven states. Twenty two percent of the total population increase in India of 371 million during 2001-26 is anticipated to occur in Uttar Pradesh alone. The population in these seven states together is expected to grow at 1.5 percent per annum during 2001-26. In contrast, the contribution of the four southern states, namely Andhra Pradesh, Karnataka, Kerala and Tamil Nadu, to the total increase in population size of the country during 2001-2026 is expected to be 47 million -thirteen percent of total demographic growth of the country. The population in these four states together is expected to grow at 0.8 percent per annum during 2001-26. Proportion of contribution of some of the other states to the total increase in population size during 2001-26 are Maharashtra (10 percent), West Bengal and Gujarat (5 percent each) and Delhi (4 percent). These four states together thus contribute 24 percent of the total increase in population size during 2001-2026. The contribution of the remaining states and union territories to the total increase in population size during 2001-2026 is 13 percent. A pie chart (Fig.4) showing the contribution of each state (except Goa and north-eastern states separately) for the total projected population growth during 2001-2026 is depicted and enclosed at the end of the present 'Summary of Findings'.
- Continuing decline in fertility and increase in the expectation of life at birth is expected to make a difference to the proportion of older population (60 years and above) between states. The State of Kerala, where lower fertility and mortality rates have been achieved earlier than the other states, the proportion of older persons aged 60 years and above is expected to increase from 11 percent in 2001 to 18 percent in 2026. Thus, almost every sixth individual in Kerala is expected to be a senior citizen by 2026. In contrast, Uttar Pradesh is expected to have an increase of the proportion of old age population from 6 percent in 2001 to 10 percent in 2026, implying that the population of Uttar Pradesh will be expected to be relatively younger compared to that of Kerala. The median age of population in Kerala is expected to go up from 28 years in 2001 to 38 years in 2026. In contrast, the median age in Uttar Pradesh is expected to go up from 19 years to 27 years. Two projected population pyramids (Figs. 5 and 6), which bring out the expected differences in Kerala and Uttar Pradesh respectively are depicted, which are enclosed at the end of the present 'Summary of Findings'. Projected median age of population at the national level and state level during 2001-2026 is depicted in Fig. 7.
- Because of declining fertility level in all the states, the crude birth rates (CBR) will also be declining. By 2021-25, except Uttar Pradesh, no state is expected to have a crude birth rate of 20 and above. The highest CBR of 20.5 per thousand is expected to be in Uttar Pradesh followed by Madhya Pradesh (18.0) during 2021-25. Assam, Chhattisgarh, Bihar, Jharkhand, Rajasthan and Uttaranchal are expected to have CBRs in the range of 16.5-17.6, close to the projected national level of 16.0. In most of the other states, the CBRs will be in the range 12-15. Kerala will be expected to have the least CBR of 12.3 followed by Tamil Nadu (12.5) during 2021-25.
- In contrast to the CBRs, the situation is expected to be different in case of crude death rates (CDR). Because of increase in the expected proportion of ageing, in some of the states namely, Himachal Pradesh, Punjab, Delhi, West Bengal, Maharashtra, Andhra Pradesh, Karnataka, Kerala, Tamil Nadu and North Eastern Region, the crude death rates are likely to increase during 2021-25 (Figs. 8 and 9).
- The infant mortality rate (IMR) is expected to decline in all the states during 2001-25. The IMR, which was highest in Orissa in 2002 at 87 is expected to come down to 52

in 2021-25, followed by Madhya Pradesh (51). Other states, where IMRs are expected to be in the range of 40-50 during 2021-25 are Jammu & Kashmir, Haryana, Rajasthan, Uttar Pradesh, Assam and Andhra Pradesh. The lowest IMR is expected to be in Kerala, from 12 in 2001-05 to 8 during 2021-25. It will be followed by Delhi with IMR declining from 25 in 2001-05 to 18 during 2021-25 (Fig. 10).

- In so far as the projected sex ratio is concerned, it is observed that in some of the northern states, the population is expected to be more masculine, that is, the ratio will decrease in 2026. Lowest sex ratio of 789 is expected to be in Delhi in 2026, followed by 839 and 840 in Haryana and Punjab respectively. In the southern and eastern states except Kerala, the situation would be reverse. In Kerala, where there are excess females than males in Census 2001, the trend would remain the same in 2026. Tamil Nadu is the other state, where the number of females is expected to be equal to the number of males in 2026 (Fig. 11).
- State-wise proportion of population expected to live in urban areas by 2026 is depicted in Fig. 12. It is observed that by 2026, 99 percent of Delhi's population would be living in urban areas, which is highest among the states, included for projecting the population by component method. In contrast, 12 percent of the population of Bihar would be expected to live in urban areas by the same year (2026), which is lowest among all the states.

CHAPTER 1

INTRODUCTION

Population projection is a scientific attempt to peep into the future population scenario, under certain assumptions by available using data at that point of time. The assumptions made with their probability of coming out to be right, forms a critical input in this mathematical effort. Predicting the future course of human fertility and mortality is not an easy task, especially when looking beyond in time is bound to be influenced by medical and health intervention strategies, food production and its equitable availability, climatic variability, socio-cultural setting, politico economic conditions and a host of other factors affecting the population dynamics. This makes it a really difficult exercise. Therefore, caution must be exercised while making or using the population projections in the context of various conditions imposed.

The need for population projection in India at various levels and by different components like age, sex, rural-urban etc., for use by the official agencies across the board, both at the centre and the states, was keenly felt in 1958 on the eve of the formulation of the Third Five Year Plan. From time to time, the official level projections of the country's population also became necessary for planning purposes. Being the second most populous country in the world, the size and growth of India's population have remained a matter of great interest not only to India but to the outside world also. Different population projections at the country level are made by the government, national and international agencies from time to time. In addition, individual demographers make their own projections for the country as a whole and, sometimes, at the sub-national level also. The international agencies which make projections for the world and for the individual countries are the United Nations Population Division, the World bank, the United Nations Population Fund (UNFPA) etc.

Previous Projections

Beginning from 1958, it has been customary for the Office of the Registrar General and Census Commissioner, India to undertake the exercise of population projection on behalf of the Planning Commission of India. The first Expert Committee on Population Projections was set up by the Planning Commission in 1958 under the chairmanship of the Registrar General, India to provide a set of population projections for India and States for use in the preparation of the Third Five Year Plan. Thereafter, this Committee was revived from time to time to revise the existing official projection figures on the basis of the latest available census data.

The Present Technical Group

In order to provide population projections, for use by the National Commission on Population, Planning commission and various working Groups set up for plan exercises, it has been set up a Technical Group on Population Projections for the period 2001-2025. The terms of reference of the Group are as follows.

- (a) To review the methodology of population projections adopted in the past.
- (b) To prepare fresh projections of fertility rate.
- (c) To prepare fresh projections of mortality rate.
- (d) To prepare fresh population projections up to the year 2025 with age, sex, urban-rural and State-Ut break ups for five year intervals.
- (e) To prepare projections of the possible period when the population replacement level TFR 2.1 will be reached by States/Uts and the country as a whole
- (f) In undertaking the above exercise, the Group may take into consideration, data/information brought out by Census 2001, SRS, NSS, NFHS and other sources as may be needed.
- (g) The Group may give interim population projections under alternative assumptions pending availability of age, sex, and distribution data from Census 2001 and may revise the interim projections, if required, when such data become available.
- (h) The group may take into account factors like level and pattern of contraceptive use, proportion of married females, the impact of major diseases like AIDS, immigration, migration etc. while undertaking population projections.
- (i) The Group may constitute sub groups to consider any specific issue and co-opt members as necessary.
- (j) The Technical Group will submit its report to the national Commission on Population by December 2001.

CHAPTER 2

POPULATION PROJECTIONS FOR INDIA

The Component Method is the universally accepted method of making population projections because of the fact that the growth of population is determined by fertility, mortality and migration rates. In this exercise, 21 States have been applied the component method. These are Andhra Pradesh, Assam, Bihar, Gujarat, Haryana, Himachal Pradesh, Karnataka, Kerala, Madhya Pradesh, Maharashtra, Orissa, Punjab, Rajasthan, Tamil Nadu, Uttar Pradesh, West Bengal, Jharkhand, Chhattisgarh, Uttaranchal, Jammu & Kashmir and Delhi. In addition, projection of the seven north-eastern states (excluding Assam) as a whole has also been carried out using the component method. For the remaining States and Union territories, Mathematical Method has been applied. The sources of data used are 2001 Census and Sample Registration System (SRS). SRS provides time series data of fertility and mortality, which has been used for predicting their future levels.

Base level population

It is well known that the age-sex data, whatever be the source, would be subject to errors to some degree. In many cases, the erroneous reporting of age is attributable to ignorance of respondents. Accordingly, there has been a need to smoothen age-sex distribution. The various indices, which measure the accuracy of age-sex data, are the sex ratio score, the age ratio score, Whipple's index and Myers' index etc. A number of methods are available for smoothing of the data pertaining to the age-sex distribution. A summary of the indices of the different smoothing procedures for all India on the basis of the Census 2001 age-sex data is given below in Statement I.

STATEMENT 1

B. SUMMARY OF INDICES MEASURING THE ACCURACY OF DATA-CENSUS 2001

Index	Reported	Smoothed	Smoothed				
			Carrier Farreg	K. -King Newton	Arriaga	United Nations	Strong
Sex ratio score	7.43	3.83	4.03	4.33	4.07	4.75	1.79
Male age ratio score	6.00	1.66	3.80	3.76	3.48	2.28	0.81
Female age ratio score	7.51	2.45	4.11	3.78	3.84	3.39	1.06
Accuracy index	35.80	15.60	20.00	20.52	19.54	19.94	7.25

Note: The accuracy index is the sum of the male and female age ratio scores plus three times the sex ratio score, all calculated using data for ages 10-14 through 65-69.

Although Strong method of smoothing gave the lowest values of sex and age ratio scores, the Technical Group recommended the following method for age smoothing. The methodology is described below.

If $W_1, W_2, W_3, \dots, W_n$ are respectively the n quinquennial age groups, 0-4, 5-9, 10-14 and so on upto 75+, then

$$S(W_2) = 0.25 * O(W_1) + 0.50 * O(W_2) + 0.25 * O(W_3)$$

Where S is the smoothed population and O is the observed population

$$\text{Similarly, } S(W_3) = 0.25 * O(W_2) + 0.50 * O(W_3) + 0.25 * O(W_4)$$

In this way, smoothing of the all the n-2 (except the first group W_1 and last group W_n) quinquennial age groups has been carried out. For smoothing, W_1 and W_n , this formula cannot be applied since there are respectively no preceding and succeeding age groups in these two cases. So, W_1 has been smoothed as under.

$$S(W_{0-4}) = O(W_{0-14}) - (S(W_{5-9}) + S(W_{10-14}))$$

$$\text{Similarly, } S(W_{75+}) = O(W_{15-75+}) - (S(W_{15-19}) + \dots + S(W_{70-74}))$$

The age and sex ratio scores based on the above smoothing procedure are mentioned in the above Statement showing the accuracy index as 15.60.

Smoothing of age sex distribution for India and all the major states including Himachal Pradesh, Delhi and North Eastern Region have been carried out by using the above-mentioned procedure. The smoothed population of 2001 by age and sex for India and the states (for which component method has been applied) is presented in Table 2.

Assumptions regarding fertility

SRS and NFHS provide estimates of TFR for States of the country. The SRS data has been used as base level estimates, these being available as a time series. The SRS data shows that in most of the States, the level of total fertility has been falling since 1971. Although annual estimates of TFR are available from SRS since 1971 till 2002 for India and major States, reliable estimates are available from 1981 onwards. It may be seen from the SRS data that there has been consistent decline in fertility during the last two decades. The trend analysis of TFR in terms of log linear, logistic and Gompertz models for projecting the future levels of fertility were discussed at length by the Technical Group. It was decided that by the Group that Gompertz model may be used for projecting the future levels of TFR in all the States as well as for the country as a whole. Following are the mathematical forms of the three models.

1. Log linear

$$L_n(\text{TFR}-1.8) = a+b(\text{time})$$

2. Gompertz

$$\frac{\text{TFR}-L}{\text{U}-L} = (a)^{b^t}$$

Or alternatively,

$$L_n(-L_n(\text{TFR}-L)/(\text{U}-L)) = L_n(-L_n.a) + t.L_n.b$$

3. Logistic

$$L_n((\text{TFR}-L)/(\text{U}-\text{TFR}))$$

Where U and L are the upper and lower limits of TFR respectively and a and b are constants.

The lowest threshold of TFR was assumed to be 1.8. For all the States except Himachal Pradesh, the observed values of TFRs from 1981-2000 were considered for projecting the future levels of TFR as the reliable estimates from SRS are available from 1981 onwards. For Himachal Pradesh, the same was considered for 1991-2000, as the same was not available for earlier years.

In fitting the Gompertz model, three types of upper asymptotes have been taken for the States depending upon whether the particular State is a higher or medium or low TFR State. The upper asymptote (U) has been taken as 6 for southern states and 7 for the northern states. For western and eastern states, U has been taken as 6.5.

The projected values of TFR for India alongwith the weighted average of TFRs for the quinquennial period 2001-2025 at five yearly intervals have been presented below in Statement 2. The weighted estimates of TFRs for India for these years are based on the TFRs of 21 States with weights being percentage share of country's females in the age group 15-49 for different quinquennial periods starting from 2001. The weighted estimates of TFR were recommended for the population projection for India.

STATEMENT 2
PROJECTED LEVELS OF TFR, INDIA, 2001-2025

Year/Period	Projected levels of TFR based on	
	Unweighted Estimates	Weighted Estimates
SRS 2000	3.2	
2001-2005	2.82	2.90
2006-2010	2.48	2.60
2011-2015	2.21	2.35
2016-2020	2.01	2.17
2021-2025	1.89	2.02

The TFR obtained through the Gompertz function specify that the replacement level TFR of 2.1 for the country as a whole is likely to be achieved by 2015 when un-weighted TFRs are taken into consideration, but when weighted TFRs are taken into consideration, the same is likely to be achieved by 2021. By 2010, the TFR is expected to reach 2.6. The probable year by which replacement level TFR of 2.1 will be achieved by different States and India, under the assumption that the recent pace of decline in TFRs (observed during 1981-2000) continues in the future years also, is shown below in Statement 3.

STATEMENT 3

YEAR BY WHICH TFR OF 2.1 WILL BE ACHIEVED

Sl. No	India and Major States	Year by which projected TFR will be 2.1
	India	2015
1	Andhra Pradesh	2002
2	Assam	2019
3	Bihar	2021
4	Chhattisgarh	2022
5	Delhi	Achieved in 2001
6	Gujarat	2012
7	Haryana	2012
8	Himachal Pradesh	Achieved in 2002
9	Jammu & Kashmir	n. a.
10	Jharkhand	2018
11	Karnataka	2005
12	Kerala	Achieved in 1988
13	Madhya Pradesh	2025
14	Maharashtra	2009
15	Orissa	2010
16	Punjab	2006
17	Rajasthan	2021
18	Uttar Pradesh	2027
19	Uttaranchal	2022
20	Tamil Nadu	Achieved in 2000
21	West Bengal	2003
22	North-East (Excl. Assam)	2005
	India (Weighted)	2021

n. a.- not available

Sex ratio at birth (SRB)

SRB for the period 1998-2000 has been presented in the report of the Sample Registration System, 2000 published by the Office of the Registrar General, India, for the country and the major states. These have been used for the present projection exercise. Since SRB for the States of Jammu & Kashmir, Chhattisgarh, Delhi, Jharkhand and Uttaranchal are not available in the said report, those for 0-6 population based on Census 2001 have been used for the exercise. In case of combined North-Eastern states, SRB has been considered based on the observation of the individual north-eastern states. The SRBs of all the states are assumed to remain constant during future years. Statement 4 showing the SRBs for the states, which have been considered for the projection exercise, is as follows:

Assumptions regarding mortality

For projecting the likely levels of expectation of life at birth (e_0), working models developed by the U.N. have been adopted. U.N. uses a standard pattern of improvement depending on whether the expectation is likely to improve slowly, moderately and fast based on historical patterns. It has been assumed that increase in the life expectancy becomes relatively slower as it reaches higher levels. The age specific survival rates were calculated by assuming that the age pattern of mortality observed in the SRS for 1999-2001 would slowly converge to the West model life table pattern as levels of life expectancy increase.

Starting with the average SRS based Age Specific Death Rates (ASDR) for 1999-2001 centered at 2000, which was taken as base year, separate life tables for males and females, separately for each state have been constructed without taking into consideration the omission factor due to death reporting. Three years average was chosen, since the year wise mortality rates particularly at the state level would be subject to higher variability. With the help of the West model life table and the expectation of life at the base level, the values of ${}_nL_x$ for each of the five- year age groups were projected up to 2021-25 by interpolation. The West Model life tables were adopted as the standard life tables for this purpose.

To decide whether high, medium or low improvement should be assumed for each state, the e_0 s for the periods 1990-94 and 1995-99 obtained from SRS Life Table have been

examined and pattern obtained through this for e_0 has been assumed to continue in future for India and all the states.

Assumptions regarding migration

Based on the migration data of Census of India 2001, inter-state net migrants during decade 1991-2001 has been assumed to remain constant throughout the projection periods for all the states (except Goa), where component method of projections were used. The component of international migration has been assumed to be negligible, so it has not been considered for projection exercise.

Projections of newly created States

Separate projections for the three truncated states of Uttar Pradesh, Bihar and Madhya Pradesh and the respective newly created states of Uttaranchal, Jharkhand and Chhattisgarh have been worked out. Since, the basic demographic information of fertility and mortality of the three truncated states of Uttar Pradesh, Bihar and Madhya Pradesh are available from the SRS data from 1999, projected TFRs of the newly created states and the truncated states were worked out by using the population of 0-6 years from the Census 2001. Since, it is known that there is a strong positive relationship between the growth rate and the child population in the age group 0-6, the ratio of the child population of each of the above mentioned six states to the corresponding total population of the respective states, as available from Census 2001, have been used for separating the TFRs of the undivided states into each of the two states. For example, the TFR of undivided U.P. has been separated into TFRs of newly created U.P. and Uttaranchal by using the proportions of 0-6 population based on Census 2001 of these two states and also the similar proportion of a state of Himachal Pradesh. The assumed expectations of life at birth by sex of a newly created state for the future years have been worked out by using the Age Specific Death Rates (ASDR) of the undivided state and adjustment factor based on NFHS-2 data of the newly created state.

Projections for combined North-Eastern States (excluding Assam and including Sikkim)

Earlier, the Component method was used for projecting the population only for major states, that is, for the states, which have population of 10 million and above. For the first time, an attempt has been made for working out the population projections of Jammu & Kashmir, Himachal Pradesh, Delhi and North-Eastern States combined (excluding Assam) by Component method. The states included in the North-Eastern States are Arunachal Pradesh, Manipur, Meghalaya, Mizoram, Nagaland, Sikkim and Tripura. This was recommended by the Technical Group. Earlier, the projections of Delhi were made by the Mathematical method because it did not fulfill the criteria of major State (its population was less than 10 million as per 1991 census). During 2001 census, its population has exceeded 10 million. Secondly, in Delhi, migration is a major component of population growth. Mathematical method does not take into consideration each of the three individual components of population growth separately. Data on fertility for Delhi has been available from 1995 onwards upto 2000, which has been used for projecting the future levels of fertility. In case of mortality, the age specific death rates for the years 1999-2001, has been used for working out the expectation of life at birth for the base year. In so far as the projection for the North-Eastern States, combined is concerned, TFRs for earlier years based on available data from 1995 onwards till 2000 has been used to project the future levels. In case of mortality, the age specific death rates for the years 1999-2001, has been used for working out the expectation of life at birth for the base year.

Based on the projected population of the combined North-Eastern Region, as worked out for the quinquennial periods 2001-2025, the projected population of each of the seven states of the region (excluding Assam) for the quinquennial periods 2001-2025 have been worked out by pro-rata distribution of the population based on Census 2001 population, that is,

- (a) Proportion of population of each of the seven states to the total population of these seven states based on Census 2001 have been worked out;
- (b) Assuming the proportions to be constant in future years as well and using the same and the total projected population of the north-eastern region for each of the quinquennial periods, the projected population of each of the seven north-eastern states for the quinquennial periods 2001-2025 have been worked out.

Population Projections for Goa and Other Union Territories

The states for which projection has been made using the Component method constitute about 99 percent of the total population as of 2001. The remaining one state and six union territories, therefore, contribute only 1 percent of the total population of India. These are Goa and the six union territories of Pondicherry, Chandigarh, Andaman & Nicobar Islands, Dadra & Nagar Haveli, Daman & Diu and Lakshadweep. The decadal growth rates of these state/union territories are erratic and, no clear trend in the growth rates is discernable. Therefore, the population of the state and six union territories have been projected by the method similar to that of rural-urban growth differential method. It has been assumed that the growth differential observed during 1991-2001 may remain the same during the future years, for which the projections have been made. Based on the residual of the projected population of India and total of the states, for which Component method has applied, projection of these state/union territories have been made. Once the population of Goa and six union territories, based on 1991 and 2001 Censuses, have been obtained by sex, these are arranged in the descending order of population as per 2001 Census. Then, the percentage share of population of the largest one (Goa, in this case) to the population of the residual based on 1991 and 2001 Censuses have been obtained. By using the Table of logistic curve in U.N. Manual VIII, projected populations of Goa for the quinquennial periods 2001-2025, have been obtained. Then, based on the revised residual (original residual population - population of Goa), projections of the next state in the descending order have been worked out by applying the similar procedure. By repeated application of the similar method, projections of the remaining union territories have been worked out.

Population Projection of Urban Population

For projecting the urban population, the URGD method as given in Manual – VIII of U.N. has been adopted. This method is based on the fact that the urban-rural growth differentials follow a logistic pattern. The URGD for the period 1991-2001 has been assumed to be same in future as well upto 2026. These projected urban population by sex for India, states and union territories as on 1st March, 1st July and 1st October are provided in Tables 10, 15 and 20 respectively.

Impact of HIV/AIDS on the projected population

The likely impact of AIDS on death rate has also been considered. It was opined by the Technical Group that in the absence of any reliable data on AIDS, making projections for the future was difficult taking into consideration its impact. There is no dependable information about male/female difference in death due to AIDS as also the effect of AIDS on the expectation of life at birth. Due to development of new medicines, perception of the people towards AIDS and subsequent human behavior may lead to uncertainties about making projections for a longer period taking the impact of AIDS into consideration. Keeping these limitations in view, the Group felt that Statewise population projections might be done without taking the impact of AIDS into consideration. Only at the All India level, the estimated number to be affected due to AIDS might be presented. Table 27 presents the relevant information.

ORDER

Sub: Constitution of a Technical Group on Population Projections.

In order to provide population projections which can be used by the National Commission on Population, Planning Commission and various Working Groups set up for plan exercises, it has been decided to constitute a Technical Group on Population Projections for the period 2001-2025. The composition of the Technical Group will be as follows:

Chairman

1. Registrar General of India

Members

2. Representative of Central Statistical Organization
3. Representative of National Sample Survey Organization
4. Representative of Department of Family Welfare
5. Representative of Perspective Planning Division, Planning Commission
6. Representative of LEM Division, Planning Commission
7. Representative of H & FW Division, Planning Commission
8. Representative of Institute of Applied Manpower Research, New Delhi
9. Representative of Indian Council of Medical Research, New Delhi
10. Director, International Institute for Population Studies, Mumbai
11. Deputy Registrar General of India, RGI
12. Dr. P.N. Mari Bhatt, Professor, PRC, Institute of Economic Growth, Delhi
13. Shri K.S. Natarajan, Former Deputy Registrar General of India
14. Prof. K.B. Pathak, Ex-Director, International Institute for Population Studies, Mumbai.
15. Joint Secretary (NCP) - Convener

Terms of reference of the Technical Group on Population Projections are given below:

1. To review the methodology of population projections adopted in the past.
2. To prepare fresh projections of fertility rate.
3. To prepare fresh projections of mortality rate.
4. To prepare fresh population projections up to the year 2025 with age, sex, urban-rural and State-UT break ups for five-year intervals.
5. To prepare projections of the possible period when the population replacement level TFR 2.1 will be reached by State/UTs and the country as a whole.
6. In undertaking the above exercise the Group may take into consideration data/information brought out by Census 2001, SRS, NSS, NFHS and other sources as may be needed.

7. The Group may give interim population projections under alternative assumptions pending availability of age, sex, distribution data from Census 2001 and may revise the interim projections, if required, when such data become available.
8. The Group may take into account factors like level and pattern of contraceptive use, proportion of married females, the impact of major diseases like AIDS, immigration, migration etc. while undertaking population projections.
9. The Group may constitute sub groups to consider any specific issue and co-opt members as necessary.
10. The Technical Group will submit its report to the National Commission on Population by December, 2001.

The Technical Group may co-opt any official or non-official as a special invitee to one or more meetings of the Group.

The expenditure on TA/DA of the non official members in connection with the meetings of the Technical Group will be borne by the National Commission on Population, as per rules and regulations of TA/DA applicable to Grade – I officers of Govt. of India or as other wise decided by the Vice Chairman, NCP. The expenditure on TA/DA of the official members, in connection with the meeting of the Technical Group will be borne by their respective Ministries/Departments.

This issues with the approval of Vice Chairman, NCP and Deputy Chairman, Planning Commission.
